

In the Specification:

On page 16, replace the second paragraph with the following:

The two electric drives 22, 24 are configured as asynchronous motors. In the only illustrated operating state of the utility vehicle 10, the mechanical steering device 42 has a straight ahead or zero ~~does not have a~~ steering angle. Without the inventive steering system the utility vehicle would only drive straight ahead. By integrating the inventive steering system in the process, however, slight directional changes can be performed by the utility vehicle 10 even with no steering angle of the mechanical steering device 42 so that for example active counter-steering of the utility vehicle in response to a substantially constant extraneous cause that is applied on the utility vehicle is not required by the operator.
